## Me

- Story 1 beta testing
- Story 2 rewriting code

## Jo Etzel, PhD Staff Scientist

- [An analysis] was coming out too good; ...some of the effects were just implausibly large, and not affected by the conditions like they should have been. ...We discovered it was a communication error resulting in incorrect condition labels. I hadn't preprocessed the dataset myself; a colleague ran the experiment at a different university and we had several meetings about its files. ...I coded up the conditions as described in my notes from the meetings ... but my notes were wrong.
- This only resulted in lost time and aggravation. But it
  was really tricky, since some of the results came out
  better, not worse, and the error was in my initial task/
  file description (so wasn't found by me comparing
  the code with my notes those matched)
